ABSTRACT

The **Support Ticket System** is a web-based application developed to simplify the process of reporting, tracking, and resolving user issues within an organization. Traditional issue management methods often rely on manual communication, making it difficult to track complaints and provide timely solutions. This project provides a centralized platform where users can create support tickets and administrators can manage them efficiently.

The system allows users to submit tickets by providing details such as name, email, subject, description, and priority level. Administrators can view all submitted tickets, monitor their status, add solutions, close resolved tickets, and delete unnecessary records. The application also provides dashboard statistics such as total tickets, open tickets, closed tickets, and high-priority tickets for better monitoring and decision-making.

The project is developed using **Java, Spring Boot, Thymeleaf, Bootstrap, MySQL, and Maven**. Spring Boot is used for backend development, Thymeleaf for dynamic web pages, Bootstrap for responsive user interfaces, and MySQL for database management.

The implemented system improves efficiency, reduces response time, and ensures better organization of support requests. It serves as a practical solution for helpdesk and customer support management and demonstrates the use of modern web development technologies in building enterprise applications.

INTRODUCTION

The Support Ticket System is a web-based application designed to manage user complaints, service requests, and technical issues in an organized manner. In many organizations, handling customer issues manually through phone calls, emails, or paper records can be time-consuming and difficult to track. This often leads to delayed responses and poor issue management.

The main purpose of the Support Ticket System is to provide a centralized platform where users can submit their issues and administrators can monitor, manage, and resolve them efficiently. Each issue is recorded as a ticket and assigned a status such as OPEN or CLOSED. The system also allows tickets to be categorized based on priority levels such as HIGH or LOW.

The application provides separate interfaces for users and administrators. Users can create support tickets by entering relevant details, while administrators can view all submitted tickets, add solutions, update ticket status, and close resolved issues. Dashboard statistics help administrators monitor the overall performance of the support system.

The project is developed using modern technologies such as Java, Spring Boot, Thymeleaf, Bootstrap, MySQL, and Maven. These technologies ensure reliability, scalability, and ease of maintenance.

The Support Ticket System improves communication between users and support teams, reduces issue resolution time, and maintains proper records of all support requests. It can be effectively used in educational institutions, organizations, and customer service environments.

OBJECTIVES

- ☐ To develop a web-based Support Ticket Management System.
- ☐ To allow users to submit support requests easily.
- ☐ To provide administrators with facilities to manage and resolve tickets.
- ☐ To categorize tickets based on priority levels.
- ☐ To track ticket status as OPEN or CLOSED.
- ☐ To maintain a centralized database of support requests.
- ☐ To improve response time and issue resolution efficiency.
- ☐ To generate dashboard statistics for monitoring ticket activities.
- ☐ To provide a user-friendly and responsive interface.

TECHNOLOGIES USED

1. Java

Java is a high-level, object-oriented programming language used for developing the backend logic of the application. It provides platform independence, security, and robustness.

2. Spring Boot

Spring Boot is a Java framework used to build web applications quickly and efficiently. It simplifies application development by providing built-in configurations and dependencies.

3. Thymeleaf

Thymeleaf is a server-side template engine used to create dynamic web pages. It integrates seamlessly with Spring Boot and helps display data from the database.

4. Bootstrap

Bootstrap is a front-end framework used to design responsive and attractive user interfaces. It improves the overall appearance of the application.

5. MySQL

MySQL is a relational database management system used to store ticket information such as user details, ticket descriptions, priorities, statuses, and solutions.

6. Maven

Maven is a build automation and dependency management tool used to manage project libraries and simplify the development process.

7. Eclipse IDE

Eclipse IDE is used as the development environment for writing, testing, and debugging the application code.

Architecture Flow

IMPLEMENTATION AND FEATURES

The Support Ticket System has been implemented with the following features:

User Features

- User Login
- Create New Ticket
- Enter Ticket Details
- Set Ticket Priority (High/Low)
- View Submitted Tickets

Admin Features

- Admin Login
- View All Tickets
- Dashboard Statistics
- Filter Tickets by Status
- Add Solutions to Tickets
- Close Resolved Tickets
- Delete Tickets

Dashboard Features

- Total Ticket Count
- Open Ticket Count
- Closed Ticket Count
- High Priority Ticket Count

RESULTS AND SCREENSHOTS

The Support Ticket System was successfully developed and tested. The application allows users to create support tickets and enables administrators to manage, resolve, and track tickets efficiently. The system provides dashboard statistics, ticket filtering, priority management, and solution management functionalities.

The following screenshots demonstrate the successful implementation of the project.

Image:1

Description: The home page provides options for User Login and Admin Login. It acts as the entry point of the application.

The home page provides options for User Login and Admin Login. It acts as the entry point of the application.

Image-2 User Login Page

A screenshot of a 'User Login' form. The form has a blue header with the text 'User Login'. Below the header, there are two input fields: 'Username' with the value 'user' and 'Password' with masked characters '*****'. At the bottom of the form is a blue button labeled 'Login'.

A screenshot of a 'Create Account' form overlaid on a background image of two people working at computers. The form has a dark background with white text. The title is 'Create Account' and the subtitle is 'Register to Support Ticket System'. The form contains the following fields: 'Username', 'Select Role' (a dropdown menu), 'Password', and 'Confirm Password'. Below the 'Password' field, there is a note: 'Password must contain: 1 uppercase letter, 1 special symbol, 8-15 characters'. At the bottom of the form is a blue button labeled 'Create Account'. Below the button is a link: 'Already have an account? Login'.

Description:

Users can log in to the system using valid credentials and access the ticket creation functionality.

Image -3 Create Ticket Page

The screenshot shows a web form titled "Create A Ticket" on the TicketGO platform. The form is set against a light blue background with a subtle grid pattern. At the top left is the "TICKETGO" logo, and at the top right is a green "Dashboard" button. The form itself is a white card with a green border. It contains the following fields: "Name *" and "Email *" (text inputs), "Subject *" (text input), "Category *" (dropdown menu with "Select Category" text), "Priority *" (dropdown menu with "Select Priority" text), "Description *" (a large text area with the placeholder "Describe your issue..."), and "Attachment (Optional)" (a file upload button labeled "Choose File" and the text "No file chosen"). A green "Create Ticket" button is at the bottom of the form. A link "Back To Dashboard" is at the bottom left of the form card. At the very bottom of the page, there is a small copyright notice: "© 2020 TicketGo".
